CALDERWICK PUMP SYSTEMS LTD

IT Disaster Recovery Plan, Version 1.2

Document code	IT-DRP-01
Version	1.2
Effective date	1 April 2025
Owner	Head of IT
Classification	Confidential

1. Purpose

This plan explains how Calderwick Pump Systems Ltd restores its IT and plant control systems after a major failure, such as the loss of a server room, a cyber attack or a long outage of a key system. It sets recovery targets, roles and the steps to invoke and run disaster recovery.

2. Roles

Table 1 - Roles

Role in disaster recovery	Calderwick role
Invocation authority (decides to invoke disaster recovery)	Head of IT; if unavailable, the Chief Operating Officer
DR coordinator (runs the recovery)	IT Service Manager
Plant control systems recovery	OT Systems Engineer
Security lead (cyber incidents)	Information Security Officer
Staff communication	Head of People
Customer and supplier communication	Chief Executive Officer's office

3. Recovery targets

The recovery time objective (RTO) is the longest time a system may be unavailable. The recovery point objective (RPO) is the most data, measured in time, that may be lost.

Table 2 - Recovery targets

System	RTO	RPO	Recovery method
Ledgerline ERP	8 hours	4 hours	Restore to the standby server at the Fenwick Bay server room
Email and collaboration	4 hours	1 hour	Cloud service with built-in failover

System	RTO	RPO	Recovery method
Engineering drawings (PLM)	24 hours	4 hours	Restore from replicated storage
Test rig control systems (Ardmoor)	12 hours	24 hours	Reload controller configurations from backup
Payroll	24 hours	24 hours	Supplier-hosted service
File shares	24 hours	24 hours	Restore from backup to the Fenwick Bay server room

4. When to invoke

Disaster recovery is invoked when a system in Table 2 is unavailable, or is expected to be unavailable, for longer than its RTO, or immediately after a confirmed destructive cyber attack. Outages that are expected to end within the RTO are handled as normal incidents by the service desk.

5. Recovery steps

- The DR coordinator confirms the scope of the failure and informs the invocation authority.
- The invocation authority decides whether to invoke and records the time.
- The DR coordinator opens a recovery bridge call and assigns recovery teams by system.
- Systems are restored in the order of Table 2, with Ledgerline and email first.
- Each restored system is checked by its business owner before users are told it is available.
- The DR coordinator writes a recovery report within 10 working days.

6. Testing

A full disaster recovery test is run once a year and a restore test of at least one system every quarter. The last full test took place on 15 March 2025.

Table 3 - Results of the full test on 15 March 2025

System	Restored in	Target (RTO)	Result
Ledgerline ERP	6 hours 40 minutes	8 hours	Met
Email and collaboration	3 hours 10 minutes	4 hours	Met
File shares	26 hours	24 hours	Missed

Faster backup storage for the file shares was installed on 18 September 2025 to meet the 24-hour target; it will be proven in the next full test in March 2026.
